The U.S. Drought Monitor continued to improve ongoing drought conditions from November 2023 to now with abundant rainfall occurring in December and January.

While no changes were made from the December 28th issuance for the first Drought Monitor issuance of 2024 on January 4th, rainfall across the area for the first half of January benefitted drought-stricken regions. Minor changes were noted to Extreme Drought (D3) locations in portions of Lawrence and Limestone Counties, but these were minimal.

Much more improvement was noted by the issuance on the 18th, when Severe Drought (D2) Conditions expanded again from Central portions of the area, now with only slivers of D3 conditions in place across far southern Cullman/Dekalb Counties, and again from SW to NE across a sliver of Colbert and much of NW Lauderdale County. Elsewhere, Severe Drought (D2) Conditions remained except across portions of Morgan, Marshall, Madison, and Jackson Counties in AL, where Moderate Drought (D1) Conditions were present.

Further improvement was noted by the issuance on the 25th, where conditions were degraded down to Abnormally Dry (D0) across portions of Jackson and Madison Counties. No changes were made elsewhere, with D2 and D3 conditions remaining in aforementioned locations.

By the final issuance for the month of January on the 30th, all categories were reduced by one level, with no areas included in D3 for the first time in 3 months. With this issuance, all counties except portions of Colbert, Lauderdale, Marshall, and Dekalb Counties will be removed from having Drought Declarations from the Drought Monitor in Storm Data.

0	01/08/24 19:00 CST	0.14M	Strong Wind (MAX 49 kt)		
0	01/09/24 04:00 CST	0			

Strong and gusty southeast non-thunderstorm or pressure gradient winds developed as a wave of showers and thunderstorms moved through the region. Frequent gusts of 40 to 50 mph were observed, resulting in numerous trees being knocked down in a few areas of north Alabama. This resulted in power lines being affected with power outages reported.

	01/09/24 21:00 CST	0	

Strong and gusty southwest to west winds developed during the midday into the afternoon hours of the 9th following the passage of a cold front. Wind gusts of 40 to 50 mph were reported, resulting in a few trees and power lines being knocked down in northwest Alabama in the Shoals area.

This is a continuation of the Jackson county tornado. The Houston county portion of the tornado is rated EF2 with max winds estimated at 130 mph. This tornado touched down in a swampy area, just east of Holmes Creek in northwest Jackson County. The tornado initially uprooted and snapped several softwood and hardwood trees, along Hickshill Road and in addition, it damaged an outbuilding there. The tornado continued northeast, damaging more hardwood and softwood trees along Piano Road. The first structure to be impacted by this tornado was a double-wide manufactured home on the northern side of Piano Road. Additional softwood and hardwood trees were snapped and uprooted along Danford Bay Road. Tree damage continued along Orchid Road, Damascus Church Road and Layton Road as the tornado continued to progress northeastward. An outbuilding was damaged along Orchid Road, and a single-family home suffered significant roof damage along Layton Road. The tornado then destroyed two ninety foot, seventy-year-old concrete silos. Damage was found along the entire length of Everett Road which was composed of the snapping and uprooting of trees, along with damage to an outbuilding and a mobile home succumbing to window damage. More trees were damaged along Heislar Road and Peanut Road as the tornado continued its northeastward trek. A single-family home on Peanut Road suffered significant roof damage. When the tornado reached Shiloh Church Loop, a single-family home suffered significant roof damage. The tornado continued to move northeast across Highway 2 where more softwood and hardwood trees were uprooted and snapped. Most of the damage to this point is classified as EF-1. Before the tornado crossed into Alabama, it damaged the roof of a small business on US-231. After crossing into Houston County Alabama, the tornado produced a continuous swath of damage on either side of State Line Road all the way towards the city of Cottonwood. This is also consistent of EF-1 damage. The first instance of EF-2 damage was when the tornado approached Cottonwood proper, along Ramer Loop rolling a single-wide mobile home, destroying it, despite it being well strapped. As the tornado moved through downtown Cottonwood, numerous small businesses sustained damage, ranging from blown out windows, roof damage and in one case the failure of the front-facing brick facade. Additional EF-2 damage occurred when the tornado removed the entire roof of a large two-story home. The tornado continued its northeastward jog, leaving Cottonwood proper, and commenced to destroy a two-story Moose Lodge that was composed of cinder-blocks resulting in another instance of EF-2 damage. The most significant tree damage noted on this survey occurred when the tornado paralleled Dyers Road, thus snapping numerous hardwood and softwood trees. The most significant damage along this northeastward path occurred on September Road where a double-wide home was completely destroyed, and resulted in one fatality. As the tornado continued to move northeast to across Whitaker Road and Creek Church Road, EF-1 tree damage was noted. The tornado caused mainly EF-0 damage to softwood and hardwood trees along Green Frog Road and Ed Tolar Road. One last structural damage occurred to a single-family home where it caused significant roof damage before lifting near the Chattahoochee River. In summary, while most damage was EF-1, there were instances of EF-2 damage with the max wind of 130 mph. In addition to the one fatality, there were also ten direct injuries from the tornado and an additional six indirect injuries during the response phase of the disaster, all in the Cottonwood area. Thanks to Houston County and Jackson County Emergency Management for assistance with this damage survey.

Direct Fatalities: F81MH

HOUSTON COUNTY ASHFORD [31.18, -85.23]			
	01/09/24 08:15 CST	10K	Thunderstorm Wind (EG 60 kt)
	01/09/24 08:15 CST	0	Source: Broadcast Media

Roof damage was reported in Ashford.

A high impact severe weather event impacted the tri-state region on January 9th with supercells producing tornadoes, large hail, and damaging wind gusts, followed by a major squall line with widespread wind damage and additional tornadoes. Preceding this activity, very strong non-thunderstorm wind gusts of 40-60 mph occurred, with even a gust to 70 mph at the Albany airport. There were 14 tornadoes confirmed across the tri-state region, including 3 EF0s, 5 EF1s, 5 EF2s, and 1 EF3. This activity was driven by a deepening area of low pressure west of the region with a record strong low level jet crossing the region. The winds at 850 mb were in in the 65-80 knot range, and sufficient instability existed to support mixing some of these very strong environmental winds to the surface.

Pictures and videos of damage DALE COUNTY 0.6 NW GRII		ocal media.		
		ocal media. 10K	Thunderstorm Wind (EG 60 kt)	

A storm chaser shared pictures of roof sheet metal blown off a peanut mill structure near 1496 CR-112 from apparent straight line winds.

A line of showers and thunderstorms with occasional gusty winds developed ahead of a cold front. Minimal instability precluded a large severe weather event, but isolated wind damage occurred.

An EF0 tornado touched down near Dick Higbee Road on the south side of the St. Michael Catholic High School where multiple trees were uprooted in a convergent pattern. It is possible the tornado touched down sooner in the adjacent field, however the next surveyable location to the west on Highway 181 did not have any visible damage. The tornado continued east from the high school causing a discontinuous path of damage including large tree limbs broken off. Any semblance of a discontinuous path disappears to the east of County Road 55 near Woodpecker Road, and the tornado end point was set at this location. The tornado was small, only peaking at around 20 yards in width with a peak wind speed of 75mph and path length of 5.09 miles.
