<p>A strong upper level storm system moved across the Southern Plains during the late afternoon and evening. At the surface, a slow moving cold front and dryline served as foci for severe thunderstorm development. With strong instability and wind shear, very large hail and damaging winds were widespread. A couple of tornadoes also developed, with the most significant tornado moving through portions of the south Oklahoma City metro.</p>

Trees and power lines down at 8th and Western in Oklahoma City.

An abundantly moist and unstable atmosphere was in place during the late afternoon and evening hours of the 31st. As a weak upper storm system moved through the region, the weak capping inversion was lifted, allowing for scattered to numerous severe thunderstorms.

A strong cold front surged through north Texas during the day of the 4th, bringing an Arctic airmass into much of the Southern Plains. As this occurred, a large scale upper level trough shifted eastward across the Southern and Central Plains region, resulting in widespread wintry precipitation. Several inches of snow and sleet fell, with significant impacts to travel.
