**A warm front/dryline triple point was present across far northwestern Oklahoma during the daylight hours. As a weak shortwave moved across the Southern Plains, strong flow aloft overspread the region. Daytime heating and the influence of the upper wave lifted the cap, allowing for scattered severe thunderstorm development.**

## Storm Data and Unusual Weather Phenomena - April 2015

Location	Date/Time	Deaths & Injuries	Property & Crop Dmg	Event Type and Details
----------	-----------	-------------------	---------------------	------------------------

Despite surface high pressure across much of Oklahoma, intense surface heating across the Texas Panhandle allowed for high based thunderstorm initiation along the dryline. Modest mid level flow then allowed these storms to propagate eastward into far western Oklahoma during the evening, producing sporadic large hail.

A warm front lifted northward during the morning hours, as a surface trough became reestablished over the Southern Plains. Between the warm front and an eastward mixing dryline, and aided by modest upper level southwesterlies, widely scattered severe storms developed across the Texas and Oklahoma Panhandles, and moved eastward into northwestern Oklahoma.

## Storm Data and Unusual Weather Phenomena - April 2015

Location	Date/Time	Deaths & Injuries	Property & Crop Dmg	Event Type and Details
----------	-----------	-------------------	---------------------	------------------------

A large cutoff upper low meandered across the western U.S. To the east, across the Southern Plains, a weak surface trough aided afternoon thunderstorm development, first over the Texas and Oklahoma Panhandles, where surface heating was more intense. More isolated activity developed in the warm sector across western Oklahoma, persisting into the evening hours. At least one tornado was observed near Sayre, with no significant damage. Elsewhere, large hail and damaging winds were reported.
